Part 1 — Operator's Manual

1.1 What this tool is

The Just Grit Website Analyzer looks at any business website the way a new customer and Google both see it, scores it 0–100, and tells you exactly what's costing that business money — in plain English, with the fix spelled out. It's two products in one: a diagnostic you sell, and a lead machine you prospect with. Run it on a prospect's site, and the report IS the outreach.

Every site gets five category scores, weighted into one overall grade:

Category	Weight	What it measures
Speed	25%	Load time, server response, page weight, render-blocking files, image handling
Search visibility	25%	Titles, descriptions, headlines, sitemap, structured data — how findable the site is on Google
Turning visitors into calls	25%	Tap-to-call, forms, calls-to-action, mobile layout, trust signals, reviews shown
Local presence	15%	LocalBusiness data, address, Google Business Profile link, named service area
Trust & basics	10%	HTTPS, secure forms, redirect health, mixed content

Grades: 90+ = A · 80–89 = B · 70–79 = C · 60–69 = D · below 60 = F. On a prospect list, **the low scores are the ones to call first** — every finding is a reason they need you.

The rule every finding must pass

What we found (a fact with a number) — why it matters (in customers or dollars, never jargon) — and the fix (an instruction you can hand a developer). If a check can't answer all three, it stays quiet. A wrong claim in a cold email costs more than a missed finding.

1.2 Starting and stopping the engine

The analyzer lives on the Mac Studio at `~/Developer/Watson/just_grit`. It runs as a small local server; the dashboard is a web page it serves at `http://localhost:8080/`.

Is it already running?

Check first — most of the time it's already up:

```
curl -s http://localhost:8080/health
```

If you get back a line starting with `{"ok": true}`, it's running — just open the dashboard in your browser. If you get nothing, start it:

```
cd ~/Developer/Watson/just_grit
.venv/bin/uvicorn api:app --port 8080
```

Leave that Terminal window open while you work (closing it stops the server). Then open `http://localhost:8080/` in any browser.

Stopping / restarting

```
kill -f "uvicorn api:app"          # stop
cd ~/Developer/Watson/just_grit  # then start again
.venv/bin/uvicorn api:app --port 8080
```

“Address already in use” is not an error to fix

If starting the server prints “error while attempting to bind on address ... address already in use”, the analyzer is ALREADY running. Don’t start a second copy — just open the dashboard.

Two habits that save headaches: always use the `.venv/bin/` prefix (the Mac has no system-wide pip or uvicorn), and never paste comment lines (anything after a `#`) into Terminal.

1.3 The Scout dashboard

The dashboard opens on the Scout cockpit. The **Prospects** tab is live — it drives the real analyzer. The other four tabs (Scout Report, Revenue, Campaign Builder, Competitor Watch) show demo data for now; the footer says so.

At the top of the Prospects tab is a connection chip. “● Analyzer connected” means live results; “○ Analyzer offline” means the server isn’t running — start it (section 1.2) and click Reconnect.

Site audit — one prospect at a time

1. Type a domain into the audit box (plain domain is fine: `rhinoroofters.com`).
2. Press Enter or click Audit. Live sites take a few seconds — the analyzer is actually loading and measuring the page.
3. Read the result top to bottom: the **score ring and grade**, the verdict sentence, six hard metrics, five category bars, then “**Fix these first**” — the three highest-impact problems, each with evidence, why it matters, and the fix.
4. “Marketing tools detected” shows their stack as chips. **No analytics** and **No retargeting pixel** are highlighted — those two gaps are your most repeatable pitch.
5. At the bottom: the **outreach opener** (one plain-spoken sentence, ready to paste into an email or say at a door) and a link to the full client report.

Market scan — a whole list at once

6. Paste domains into the list box, one per line (up to 250).
7. Click Scan. Expect roughly 1–2 seconds per site.
8. Results come back **ranked worst-first** — that’s your call order. Sites that failed to load sort to the very top: a site that’s down is the easiest pitch on the list.
9. The summary tiles show sites scanned, average score, how many have no retargeting, how many have no analytics. “Scout’s read on this market” turns the list into a one-paragraph market story you can use in any pitch.
10. Each row has a Copy opener button — a per-prospect opening line, ready to send.

1.4 The client report

Every audit has a shareable, client-facing report at:

```
http://localhost:8080/report?url=THEIR-DOMAIN.com
```

It's branded, jargon-free, and structured for a business owner: grade up top, the fix list in priority order, each finding in what/why/fix format, and an honest note about how we measured. To hand it to a prospect, open the report in the browser and print to PDF (File → Print → Save as PDF), then attach it to your follow-up email or bring it printed to the door.

The report is the product demo

You are not asking the prospect to imagine what you do — you're handing them proof you already did it. Nothing in the report is padded, and every fix is real. That's the credibility the whole sales motion runs on.

1.5 Command line (optional, for batch work)

Everything the dashboard does is also available in Terminal. Run these from the just_grit folder:

Command	What it does
<code>.venv/bin/python -m grit_analyzer.cli DOMAIN</code>	Audit one site, print the results
<code>... DOMAIN --report out.html</code>	Also write the client report to a file
<code>... --batch list.txt</code>	Score every domain in a text file (one per line), ranked worst-first
<code>... --compare a.com b.com c.com</code>	Competitor mode: rank 2–10 sites against each other
<code>... --history DOMAIN</code>	Show every stored scan of a domain and whether it improved or got worse
<code>... --suppress DOMAIN</code>	Add a domain to the do-not-scan list

1.6 Competitor mode and score history

Competitor mode

Feed it a market — your prospect plus their four biggest competitors — and it ranks the field, names the leader, finds each site's weakest category, and writes a **“sell against”** line for every company. Use it two ways: to show a prospect exactly where they sit in their own market (nothing motivates like being ranked 4th of 5), and to prep before a meeting so you know the local landscape cold.

Score history — two sales plays

Every scan is saved automatically. When you scan the same site later, the analyzer compares scores over time. That powers two plays:

- **Prospecting:** “Their site got worse” — rescan your prospect list monthly; a dropped score is a fresh, factual reason to call.

- **Retention:** “Here’s what we did” — scan a client’s site before you start work and after you finish. The before/after score is your proof of value, in one number.

1.7 Rules of the road (do not skip)

These rules are built into the tool and are non-negotiable. They’re what keeps the whole operation clean, legal, and worth trusting:

- **We only look at public pages** — the same pages anyone’s browser loads. No logins, no form submissions, no security probing, no personal data.
- **We honor robots.txt.** If a site asks not to be visited by tools, the analyzer refuses to scan it and tells you why.
- **We identify ourselves.** The analyzer announces its name and contact address on every visit. No disguises.
- **We honor opt-outs.** If any site owner asks to be left alone, add their domain to the do-not-scan list immediately (section 1.5) — it’s honored everywhere, permanently.
- **When in doubt, the tool stays quiet.** It would rather miss a finding than put a wrong claim in your email.

1.8 Troubleshooting

Symptom	What it means / what to do
“command not found: pip” or “uvicorn”	You’re missing the .env/bin/ prefix. Use the exact commands in section 1.2.
“Address already in use” on start	The server is already running. Just open the dashboard. (Section 1.2.)
Dashboard chip says “Analyzer offline”	The server isn’t running, or the endpoint box has the wrong address. Start the server, keep the endpoint at <code>http://localhost:8080</code> , click Reconnect.
A site comes back “could not be loaded”	Some sites block all automated visitors, some are genuinely down. Either way it’s noted honestly — and a site that’s down is itself a pitch.
“Rate limit reached” message	Built-in safety brake (10 audits/min, 6 batch scans/hour). Wait the number of seconds shown. It exists so the tool can never hammer anyone’s server — or yours.
Scan seems stuck	Large lists take time (1–2s per site). 100 sites ≈ 3–4 minutes. Leave the tab open.
After a Mac restart, nothing works	The server doesn’t auto-start. Run the two start commands in section 1.2.

Health check any time: `curl -s http://localhost:8080/health` — shows version, cached audits, and total scans stored.

Part 2 — Field Guide: Turning Reports Into Customers

The analyzer's job is to hand you a conversation that's already half-won. This part is the playbook for that conversation.

2.1 The core motion

11. Build a list of local businesses in one vertical (roofers, HVAC, plumbers, restaurants).
12. Run the list through Market Scan. Call order = worst score first, dead sites at the very top.
13. For each call/email/knock: copy the outreach opener, personalize one detail, send or say it.
14. When they bite: send the full client report (print to PDF). Free, no strings. The report does the selling.
15. Close on fixing what the report found — then rescan after the work to prove the improvement (section 1.6).

2.2 Why the opener works

The opening line is deliberately **never jargon**. The tool ranks findings separately for the email: “your phone number isn't tap-to-call” starts a conversation; “no LocalBusiness structured data” does not. It always leads with the most human-relatable problem, phrased the way you'd say it across a counter.

A good send looks like this:

Example outreach email

Subject: quick thing I noticed on your website
Hi Mike — I ran rhinoroofters.com through the site check we use before we take on any marketing work, and one thing jumped out: your phone number isn't tap-to-call — on a phone, tapping it does nothing. It's a quick fix — I put the full report together for you, no strings. Want me to send it over? — Daniel, The Watson Factor

Rules for the send: one finding only (the report has the rest), no attachments on the first touch, and the ask is “want the report?” — not “want to buy?”. The report earns the second conversation; the second conversation earns the sale.

2.3 The repeatable market pitch

Across every vertical we've scanned, two gaps keep showing up: **no retargeting pixel** (most first-time visitors leave and are lost forever — the cheapest lead a local business can buy is the one who already visited) and **missing LocalBusiness data** (the site isn't telling Google what the map listing needs to hear). Same two problems, business after business. That's not a weakness of the pitch — it IS the pitch: you can walk into any shop in the vertical knowing what's probably wrong before you scan.

2.4 At the door

- Scan the night before. Have the score and the one plain-spoken finding in your head, not on paper.
- Open with the finding, not the company: “I was looking at your site — did you know tapping your phone number on an iPhone does nothing?” Let them pull out their phone and see it. The demo is theirs, not yours.
- The leave-behind is the printed report with your card. It keeps selling after you leave.

- Goal of every knock: the decision-maker's direct email — that's where the report goes.

2.5 What not to do

- Don't send a report to a business we've been asked not to contact — and if anyone asks to be left alone, suppress their domain the same day (section 1.5).
- Don't exaggerate a finding. The tool understates on purpose; match it. "Your site is broken" loses; "one thing jumped out" wins.
- Don't lead with score or grade in the first touch — grades feel like an attack. Lead with the single relatable finding.
- Don't promise a specific ranking or revenue result. Promise the fix and the before/after rescan — those we can always deliver.

Part 3 — Understanding Your Website Report

This section is written for you, the business owner. Print it, or copy it, and hand it out with any report.

3.1 What this report is

We loaded your website exactly the way a customer's phone does — same public pages, nothing private, no logins, no tricks — and measured what happened. The result is a score out of 100 and a short list of specific problems, each with three parts: what we found, why it matters to your revenue, and precisely how to fix it.

The score is not a judgment of your business. Plenty of excellent companies have low-scoring websites — that's actually the point. A great roofer with a website that loads slowly and can't be tapped to call is losing jobs to a worse roofer whose site works. The report shows where that's happening.

3.2 How to read your score

Grade	What it means
A (90+)	The fundamentals are done right. The fix list is fine-tuning.
B (80–89)	Solid, but leaving customers on the table. Usually a handful of high-value fixes.
C (70–79)	Looks fine to a person, mediocre to Google. Fixable — and worth fixing.
D (60–69)	Actively losing business to better-tuned competitors.
F (below 60)	Problems serious enough to cost customers today.

The five category bars under the score show where the points went. The ones marked in red and orange are where your money is leaking.

3.3 The severity labels

Label	Meaning
Critical	Costing you customers right now. Fix this week.
Serious	A real, measurable leak. Fix this month.
Worth fixing	Clear improvement, moderate effort. Fold into your next site update.
Minor	Polish. Do it when someone's already in the code.

3.4 What we did — and didn't — do

- We visited only your public pages, the same ones any visitor sees. We announced who we were on every visit.
- We did not log in to anything, submit any form, test any security, or collect any personal data about you or your customers.

- If your site asks not to be visited by tools (a standard file called robots.txt), we honor that — and we honor “please don’t scan me again” requests permanently.
- Speed was measured from a fast connection. Real phones on cell service are usually slower — so if the report says your site is slow, your customers are having a worse experience than the number suggests.

3.5 What to do with the fix list

Every fix is written so you can hand it directly to whoever built your website — it names the exact change, not a vague goal. Most items on a typical list are under an hour of developer time. You have three options, all legitimate:

- **Hand it to your web person.** The report is written for exactly that. No further translation needed.
- **Do the easy ones yourself.** If your site is on Wix, Squarespace, GoDaddy or WordPress, several fixes (page title, description, tap-to-call number) are settings, not code.
- **Have us do it.** We fix what’s on the list, then re-run the same scan and show you the before and after. You’ll see the improvement in the same score that found the problems.

Questions?

The Watson Factor · San Antonio & New Braunfels · turnkeytexas@icloud.com. The scan behind this report is ours — we’re happy to walk through any finding and what it’s costing you, no charge.
